

SYSTEM AND METHOD FOR GRANULAR CONTROL OF MESSAGE LOGGING

ABSTRACT OF THE DISCLOSURE

A system and method for controlling log files is provided in which each log file entry is associated with an importance level. Depending on the importance level, the log entry is stored in a separately maintained set of files which can thus be rotated on different schedules so that the more important log file entries are retained for appropriately longer periods of time so as to be better able to reconstruct event histories and reports for important events.
